

Claims

- 5 1. A syringe for dispensing foam comprising:
- (a) a syringe plunger having a waste chamber communicating with an inlet in
 a front face of the plunger; and
- (b) a syringe barrel having a nozzle and a bore to receive the plunger.
- 10 2. A syringe as claimed in claim 1 wherein the internal waste chamber is
 provided with a vent which comprises either a hydrophobic vent or a hole in a
 wall of the chamber.
3. A syringe as claimed in claim 1 or claim 2 wherein the chamber has one or
15 more flexible walls.
4. A syringe as claimed in claim 3 wherein the chamber is substantially empty of
 air.
- 20 5. A syringe as claimed in claimed in claim 3 or claim 4 wherein the chamber is
 retained within a rigid walled chamber or frame comprising part of the
 plunger.
6. A syringe as claimed in any of claims 3 to 5 wherein the said flexible wall or
25 walls is/are substantially inextensible.
7. A syringe as claimed in any preceding claim wherein the inlet to the chamber
 is adjacent the syringe nozzle when the plunger is in its fully depressed state.
- 30 8. A syringe as claimed in any of claims 3 to 6 wherein the flexible chamber is
 contained within a space defined by rigid walls of the plunger, and vents are
 provided in the said rigid walls to allow air between the chamber walls and the
 said rigid plunger walls to escape when the chamber is filling with foam.

9. A kit for providing a syringe full of foam, the kit comprising a syringe as claimed in any preceding claim together with a source of foam.
10. A kit as claimed in claim 9 wherein the source of foam is a pressurised canister containing liquid to be foamed and gas under pressure.
11. A method of dispensing foam using a syringe as claimed in any of claims 1 to 8 comprising the steps of:
- (a) connecting the syringe to a source of foam; and
 - (b) dispensing a continuous flow of foam into the syringe from the source;
 - (c) whereby the flow of foam initially enters the waste chamber such that foam fills or substantially fills the said waste chamber; and
 - (d) the flow of foam subsequently pushes the syringe plunger back in the syringe barrel and starts to fill the syringe.
